#### Abstract

Head losses are very common in penstock trifurcations. In this paper, six cases of 3D asymmetric trifurcations have been modeled with main pipe length \& diameter of $1.3716 \mathrm{~m} \& 0.0254 \mathrm{~m}$, respectively and branch pipe lengths \& diameters of $0.762 \mathrm{~m} \& 0.0196 \mathrm{~m}$, respectively. Volumetric flow rates, velocity magnitudes, dynamic and total pressure contours and their values have been computed. Energy loss coefficients have been computed for branch pipes for an input air velocity of $3 \mathrm{~m} / \mathrm{s}$ by pressure data obtained from the CFD analysis. The maximum values of velocity magnitude, dynamic and total pressures are observed in the branch-2 and head losses in branch-2 are relatively less.

Keywords-Head losses, Energy loss coefficients, 3D asymmetric trifurcations.

## I. Introduction

In penstocks used for hydropower projects, trifurcations along with the other components, help in producing electricity. These trifurcations supplement water supply to multiple turbines at the same time. Despite having the economical advantage over independent systems, even this system is not free from losses. The comparison of velocity magnitudes, dynamic and total pressure contours and determination of head loss coefficients in the branch pipes sums up the interest of this study.

## II. Domain

A total of six cases have been modeled using Gambit 2.4.6, with each model displaying an asymmetry about the central branch axis. The dimensions used for the six cases in the current analysis are shown in the table 1 .

Table 1
Dimensions of Asymmetric Trifurcations

| Dimensions | In Meter |
| :---: | :---: |
| Length of Main Pipe (L) | 1.3716 |
| Diameter of Main Pipe (D) | 0.0254 |
| Lengths of branch pipes $\left(\mathrm{l}_{1}, \mathrm{l}_{2}, \mathrm{l}_{3}\right)$ | 0.762 |
| Diameters of branch pipes $\left(\mathrm{d}_{1}, \mathrm{~d}_{2}, \mathrm{~d}_{3}\right)$ | 0.0196 |

The angle between the branch -2 and branch -1 is termed " $\alpha$ " and the angle between the branch -2 and branch -3 is termed " $\beta$ ". The angles used for the six cases are shown in the table 2.

Table 2
Angles " $\alpha$ " and " $\beta$ " FOR THE SIX CASES

| Case No. | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{5}$ | $\mathbf{6}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Angle " $\alpha$ " in Degrees | 5 | 10 | 15 | 10 | 15 | 20 |
| Angle " $\boldsymbol{\beta}$ " in Degrees | 10 | 15 | 20 | 5 | 10 | 15 |

A model created using Gambit for the case 2 of this study is shown in figure 1 .
Mesh of T-Grid type using Tet/Hybrid elements was generated for all the six cases in Gambit. A typical mesh generated for the case 3 of this study is shown in figure 2

Fig. 1: Gambit Model of Trifurcation

Fig. 2: MESHED TRIFURCATION

The mesh sizes for all the cases are enlisted in table 3.
Table 3
Mesh Sizes for the Six Cases

| Case | Mesh Size |  |  |
| :---: | :---: | :---: | :---: |
|  | Cells | Faces | Nodes |
| 1 | 469301 | 978796 | 99471 |
| 2 | 320336 | 674755 | 71535 |
| 3 | 320336 | 674755 | 71535 |
| 4 | 316436 | 666226 | 70469 |
| 5 | 321042 | 676181 | 71632 |
| 6 | 314140 | 662439 | 70526 |

The boundary conditions for all the six cases were applied as shown in the figure 3 and table 4 .

FIG. 3: APPLICATION OF THE BOUNDARY CONDITIONS AT INLETS AND OUTLETS

TABLE 4
BoUndary Conditions For The Domain

| Pipe | Entity | Boundary Condition Type | Magnitude |
| :---: | :---: | :---: | :---: |
| Main Pipe | Face | Velocity Inlet | $3 \mathrm{~m} / \mathrm{s}$ |
| Branch Pipe-1 | Face | Pressure Outlet | 0 Pa |
| Branch Pipe-2 | Face | Pressure Outlet | 0 Pa |
| Branch Pipe-3 | Face | Pressure Outlet | 0 Pa |

Ansys fluent 13.0 was the solver used for the analysis. The details of the fluid properties and solver parameters are given in the tables 5 and 6 respectively.

TABLE 5
Fluid Properties

| Fluid | Fluid Properties |  |
| :---: | :---: | :---: |
|  | Density | Viscosity |
| Air | $1.225 \mathrm{~kg} / \mathrm{m}^{3}$ | $1.7874 \times 10^{-5} \mathrm{~kg} / \mathrm{m}-\mathrm{s}$ |

Table 6
SOLVER PARAMETERS, INITIALISATION AND CALCULATION DETAILS

| Pressure-Velocity Coupling | Simple |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Spatial Discretization | Gradient | Least Square Cells Based |  |  |
|  | Pressure | Second Order |  |  |
|  | Momentum | Second Order Upwind |  |  |
| Solution Initialization | Initialisation Methods | Standard Initialisation |  |  |
|  | Reference Frames | Relative to Cell Zone |  |  |
| No. of Iterations | 1000 |  |  |  |

The analysis has been carried out for the six cases under the following assumptions:

- No slip condition; which means that the relative velocity of the fluid at the solid boundaries is zero.
- The fluid flow is incompressible.
- Air is a Newtonian fluid.
- Steady flow occurs.

## III. Volumetric Flow Rates, Velocities and Dynamic \& Total Pressure Values

The values of velocity magnitudes, dynamic and total pressures have been obtained for the branched flow as well as inlet for the surface areas of all the six cases from fluent. These values are tabulated in the tables 7-12.

Table 7
Volumetric Flow Rates, Velocity Magnitudes, Dynamic and Total Pressures for Case 1

| Surface Area | Volumetric Flow Rate <br> $\left(\mathbf{m}^{\mathbf{3} / \mathbf{s})}\right.$ | Velocity Magnitude <br> $(\mathbf{m} / \mathbf{s})$ | Dynamic Pressure <br> $(\mathbf{P a})$ | Total Pressure <br> $(\mathbf{P a})$ |
| :---: | :---: | :---: | :---: | :---: |
| Inlet | $1.5 \times 10^{-3}$ | 3 | 5.3621 | 15.7877 |
| Branch Pipe-1 | $4.32 \times 10^{-4}$ | 1.44 | 1.4374 | 1.4466 |
| Branch Pipe-2 | $6.94 \times 10^{-4}$ | 2.32 | 3.6253 | 3.6428 |
| Branch Pipe-3 | $3.82 \times 10^{-4}$ | 1.28 | 1.1392 | 1.1464 |

## VII. Calculation of Head Loss CoEfficients

The head losses in the individual branches can be calculated using the following formula [1]:

$$
\begin{equation*}
k=\frac{\left(P_{T 1,2,3-} P_{T \text { Inlet })}\right.}{\frac{1}{2} \rho V_{\text {Inlet }}^{2}} \tag{1}
\end{equation*}
$$

Where;
$\mathrm{P}_{\mathrm{T} 1,2,3} \rightarrow$ Total Pressure in branches 1,2 and 3
$\mathrm{P}_{\mathrm{T} \text { Inlet }} \rightarrow$ Total Pressure in Inlet Pipe
$\mathrm{V}_{\mathrm{T} \text { Inlet }} \rightarrow$ Reference flow velocity at Inlet
$\rho \rightarrow$ Density of air
The velocity magnitudes and pressure values obtained from the fluent analysis are used to carry out the calculations of head losses for all the branches of each trifurcation case. The reference inlet flow velocity ( $\mathrm{V}_{\text {Inlet }}=3 \mathrm{~m} / \mathrm{s}$ ) [2] and density of air ( $\rho$ $=1.225 \mathrm{~kg} / \mathrm{m}^{3}$ ) are constant for all the calculations.

The head loss coefficients have been calculated and their values have been tabulated in the table XII.

The above formula yields negative values of head loss coefficients for all the branches of trifurcations. However, the nondimensional coefficients ( $k$ ) can be called energy change coefficients rather than head loss coefficients whenever branching of flows occurs [3]. Thus, the negative sign can be ignored here and head loss coefficients can be considered as energy loss coefficients.

Table 12
Head Loss Coefficients in the Branch PiPes of Asymmetric Trifurctions

| Trifurcation Case No. | Head (Energy) Loss Coefficients (k) |  |  |
| :---: | :---: | :---: | :---: |
|  | Branch-1 | Branch-2 | Branch-3 |
| 1 | 2.60 | 2.20 | 2.65 |
| 2 | 2.63 | 2.23 | 2.72 |
| 3 | 2.69 | 2.26 | 2.73 |
| 4 | 2.67 | 2.25 | 2.53 |
| 5 | 2.70 | 2.26 | 2.64 |
| 6 | 2.72 | 2.30 | 2.69 |

## VIII. DISCUSSION OF RESULTS

The velocity magnitude contours, dynamic pressure contours and the total pressure contours for all the six cases are as shown in the figures 4 to 9,10 to 15 and 16 to 21 , respectively. It has been observed that the velocity magnitudes, dynamic and total pressures in the branch pipes decrease with the increase in the trifurcation angles for all the six cases. And also maximum values have been observed in the branch- 2 .

From the analysis of the contours for all the above six cases, it can be seen that the values of velocity magnitude, dynamic and total pressures are maximum in the central branch (branch-2) of the trifurcation. The distribution of velocities, pressures and separation of flow in the other two branches of the trifurcation mainly depends upon the turbulence at pipe trifurcation junction, angle of trifurcation, and diameter ratio [4].

The values of energy change coefficients have been calculated for all the six cases of trifurcations and are tabulated as shown in the table XII. It can be observed that the branch-2 head loss coefficients are smaller compared to that of the other two branches. This is because there is only change in the pipe area and more energy dissipation that is taking place is because of the viscous friction at the wall, while the side branches suffer a directional flow change (secondary flow) along with the cross-sectional variation [1].

## IX. CONCLUSION

Energy (head) loss analysis has been carried out and volumetric flow rates, velocity magnitudes, and dynamic \& total pressures have been determined for all the six cases of asymmetric trifurcations. It is seen that the fluid flow rate, velocity magnitude and dynamic \& total pressures are more in the branch-2 compared to the other two branches. Smaller values of head losses have been obtained for branch-2 in all the cases. This is because there is only change in the pipe area and more energy dissipation that is taking place is because of the viscous friction at the wall, while the side branches suffer a directional flow change (secondary flow) along with the cross-sectional variation [1]. The turbulence at pipe trifurcation junction, angle of trifurcation, and diameter ratio are mainly responsible for the losses and separation of flow [4].
